

FSAB Management Policy

Fagersta Stainless AB ensures – by means of its business management system – that the production of stainless wire from hot rolling and cold drawing, has controlled processes leading to continuous improvements within:

Safety: we prevent and limit the consequences of serious accidents

Quality: our products shall meet our customers requirements and hopefully exceed expectations

Environment: we continuously work with minimizing and preventing environmental impact and pollution as well as improving our environmental performance

Working environment: we prevent risks for occupational diseases and accidents

Energy: we identify energy wastage and improve energy performance

We accomplish this by systematic procedures throughout the organization along with the work of targets and key figures from a life cycle perspective. We prevent nonconformities by identifying and handling risks efficiently. With continuous competence development we can assure adequate skill among all staff. The management makes sure we have enough resources. We continuously analyze the world around us to make sure we follow and have control over laws and other obligations that have impact on our business. Regular internal audits are used as a tool to measure conformity of obligations and to make sure we meet our policy and targets.

Johan Wiklund

Managing Director
